

HeroTill has added a feature to the [Customer Mobile App](#) to allow a customer to see their realtime line utilisation.

This will only work if the user is connecting from a CPE radio directly to a NAS router that is being managed by HeroTill with an active API login.

**Note:**

If the user is performing a PPPoE dialup from a router behind the CPE then the session cannot be seen currently.

Realtime view is only available when PPPoE connections are done directly from the CPE to the NAS router, and API access is enabled from HeroTill into the NAS router.
